

Tally Prime Integration Guide

Saarlekha Stores & Purchase Connectivity Guide

This guide explains how to connect your local Tally Prime client/server to the Saarlekha Stores & Purchase cloud platform using the standalone LAN Bridge Agent.

1. Architecture Overview

The LAN Bridge Agent runs inside your factory or accounting network. It polls Tally Prime locally (via port 9000 XML server) and communicates outbound to Saarlekha Cloud over standard HTTPS. No inbound port forwarding or firewall exceptions are required on your local router.

2. Setup Instructions

Step 1: Register a LAN Bridge Agent in Saarlekha

1. Navigate to the ERP & Tally Settings page on the Saarlekha platform.
2. Scroll to the LAN Bridge Agents panel at the bottom.
3. In the Agent location name field, type a name identifying the machine where the agent will run (e.g. Office Accounting Server).
4. Click Add and copy the generated Bridge Token (e.g. agent_clpx82j...). Keep this token secure.

Step 2: Enable HTTP Connectivity in Tally Prime

Configure Tally Prime to listen for XML/HTTP queries:

1. Open Tally Prime, click F1: Help > Settings > Connectivity.
2. Set 'TallyPrime acts as' to 'Both' (or 'Server').
3. Set 'Enable HTTP server' to 'Yes' and set 'Port' to '9000'.
4. Save the settings and restart Tally Prime, then open your company (e.g., CROX FY 2024-25).

Step 3: Run the Bridge Agent Locally

Run the bridge agent on the machine that has access to Tally Prime and the Internet. Ensure Node.js (v16+) is installed on that machine.

Open a terminal/command prompt in the bridge-agent folder and execute:

```
node bridge-agent.js https://saarlekha.com YOUR_BRIDGE_TOKEN
```

Step 4: Map Ledger Accounts

To link your Saarlekha Vendors with Tally accounts:

1. Go back to the ERP & Tally Settings page in Saarlekha.
2. Under the Ledger Account Mappings tab, select a Saarlekha Vendor.
3. Type the exact Tally Ledger Account Name and click Add Mapping.

3. Troubleshooting

Tally Offline Error

If the agent logs 'Tally offline', verify Tally is running on the same machine, and connectivity settings (HTTP server enabled, port 9000) are correct.

Firewall or Antivirus Blocks

Ensure Windows Firewall or local Antivirus is not blocking port 9000. You can add an inbound firewall rule allowing TCP port 9000 if necessary.
